The 4-2 Rule is a way to turn the number of drawing outs you have into your odds of hitting it. It's 4 times the number of outs on the flop to hit on the turn or river, and time 2 on the turn to hit on the river. Example: A flopped-flush draw has 9 outs; multiply by 4 to get 36, and then divide by 2 to get 18. This means a player with a flush draw on the flop has a 36% chance of hitting by the turn, and a 18% chance of hitting by the river. That's the argument that doesn't hold up if it involves an experienced poker pro! That's the excuse Brazilian poker player Rafael Caiáffá made during a recent tournament, but his antics have cost him an indefinite ban from the game: Pro Poker Quadro Banned for Cheating on and Brasil National Series of Poker casino.
