Sports betting is a type of gambling that refers to the

activity of placing a wager on the outcome of a sporting event.

The sports betting and

lottery market size worldwide was over 200 billion U.S. dollars in

2024. (Check the latest report)

Millions of people are spending their money for earning or for just

fun every day.

As a senior developer with vast experience in web automation

, I have worked on several projects related to sports betting automation.

Web automation could

bring a huge value in many fields, let alone betting.

The first bot I made an

auto-cashout bot. It monitors all bet slips and clicks on the

cashout button (you give

according to the predefined

rule. Yes, you are right, it is the stop profit or stop loss rule

as in the financial market.

The second bot was an arbitrage betting bot that aims to profit from the

gap of odd values on two bookmakers. (Bet365 and Williamhill in my)

Arbitrage sounds wonderful, right? It means a money-printer that

makes a profit in any case. Because

there are dozens of bookmakers, the odd values for the same event differ

from one to another, especially for live betting.

This second bot was not easy to implement.

It has

to identify the arbitrage opportunity.

The bot has to scan all events of the

interesting sports realtime on two bookmakers and identify where the

arbitrage exists.

In my case, I was only interested in football, I built this part myself.

But if you

need this for all sports this is quite a sophisticated part

that needs a bunch of

scraping threads. To simplify this step,

you can consider the

third-party service
