

slot game asia

In Vue.js, slots are a way to pass content to a component. They allow you to reuse a section of the component's template that can be replaced by the parent component.

Understanding the parent's control and layout of its child is essential for using slots. Types of benefits using slots include:

- Reusable components
- Flexibility in layout
- Ability to reuse content

That alone for more flexible and reusable components. We use slots from the parent.
